

We have decided to first and foremost build a website for our bike-rental-service and will use HTML and Javascript to do this. I have only surface level experience with both, which will not be enough to do anything productive, or at least anything good. I want to be able to build a website with basic functionality using HTML, Javascript and CSS, and have it be at least somewhat good and nice looking. To reach this goal, I have group members that have significantly more experience with HTML and CSS than I have who can probably teach me a lot. There is also a plethora of online tutorials touching everything regarding websites which I will make use of.

We have also decided to use Trello which I, and our group, will have to learn during our work. Me and some others from the group have experiences with a system such as Trello, Azure Devops more specifically, which will certainly help those who have no experience at all.

Our group have just recently discussed how to approach Scrum, but we have not discussed any roles.

This week I have primarily contributed to the design choices we sketched for our system and what functionality it will have. I also participated in writing user stories for our first sprint
