

Personal reflection, week 5

Ivan Lyesnukhin

-what do I want to learn or understand better?

In the relation of the last week I feel myself pretty confident in using of React. During the last week I was doing the task together with another group member. Our task was to create a map for displaying the bicycles. In the beginning we worked together, we created a common base to proceed from and after this we worked separately. It was going very well and in my opinion it was a very productive cooperation.

I think I have achieved all the goals I had in the beginning of the project, i.e. having better understanding of React and JavaScript, so right now my goal is to implement and practice my knowledge and I want to achieve it by taking and performing more complicated tasks.

-how can I help someone else, or the entire team, to learn something new?

As it was mentioned before, during this week I was working in pair with my colleague and we had a great cooperation. The things I did not understand were explained to me by him, meanwhile some things I found were more efficient to implement I shared with this group member so we worked on the same things. If anyone has some error, some bug, some difficulties, he/she always can text in Slack and everyone does it. This is how it works in our group, this works very well and we are going to keep going on this way.

-what is my contribution towards the team's use of Scrum?

We use Scrum technology completely. As it was on the previous sprint, every group member got its own task to perform. The difference compared with the previous week was that I got a common task to perform with another group member, but after some work we performed, we divided it into two tasks so we could work separately.

The things that need to be changed are mergings branches with Git-master branch. Right now we take big tasks and in the end of the sprint it appears that we have many big completed tasks but on the different machines, i.e. the tasks are not integrated into master-branch. So we need to improve our integration and we are going to do it by decreasing the size of the tasks, but increasing the number of them. As we think, it must lead to more frequent merging with master which will result into better integration.

-what is my contribution towards the team's deliveries?

This topic is unchanged from the previous sprint. The only Attending on the meetings, taking part in discussions and giving constructive proposals. As I mentioned before, we had a great cooperation between all group members and I we have discussed a lot of things like using of git, css, html, React, JavaScript. I was giving different types of proposal, some were accepted by the group, some were not. On the same time I was giving feedback to others and I think I made a contribution to the form of our project. I do my part of the work, which is some task

to perform and it results into some part of the end product. When everyone is doing its part we get the whole product. I will continue to do my tasks so we can create our application.
