

Personal reflection, week 2

Ivan Lyesnukhin

-what do I want to learn or understand better?

In the relation of the last week I became more and more comfortable with using of Git, the workload in the team is gaining momentum, we began to use slack in our conversations which was very unusual when we just began, but now it is not any problem any longer.

I wanted to understand the business model which I didn't know before, but thanks to good explanations of Industrial Management students I have a little bit clear picture about it now.

Another thing that became better is that we now know what type of product we will develop and what goals we want to achieve in this course, however there are some things we have to think about: architecture of the program, user stories, what language we want to write our program in, what database should we use and how we divide tasks between the group members, i.e. who is responsible for what.

-how can I help someone else, or the entire team, to learn something new?

This thing is unchangeable from the last week. When I know something and I see that someone does not know it I will just explain. During this week IT students helped I-students with some IT related things, while I-students helped IT-students (and me) with some economy related topics. This cross-program cooperation was working perfect. On the other hand I want to read little bit more by myself about things I need to perform the implementation of the product and this knowledge I can use to explain to my colleagues.

-what is my contribution towards the team's use of Scrum?

The Scrum can be used when we have some sprint. We have not started sprint yet, but one thing, which is on some way related to the Scrum, was done: we divided our group on two parts for writing user-story- one part was writing user story from rentee perspective, another one from the renter perspective. We had a great cooperation, we wrote down all user stories and on this way we created a good base for the future use of Scrum.

From the next week I want to have the real use of Scrum by taking task and doing it during the sprint.

-what is my contribution towards the team's deliveries?

Attending on the meetings, taking part in discussions and giving constructive proposals. As I mentioned before, we had a great cooperation between all group members and I we have discussed a lot of things: everything from business model and to design of the application. I was giving different types of proposal, some were accepted by the group, some were not. On the same time I was giving feedback to others and I think I made a contribution to the form of our project. I hope that by the time I will give more and more feedback and proposals to my group.
